Zend Framework: Surviving The Deep End - Performance Optimisation For Zend Framework Applications

It took longer than expected to prepare this weeks Chapter (or Appendix rather!) but it's finally available as part of the free Zend Framework: Surviving The Deep End book online at <http://www.survivethedeepend.com>.

This week's chapters explores some of the performance issues and tactics worth being aware of when developing Zend Framework, and indeed other, applications. It's a rather long piece of work but I hope it proves enlightening. Comments are, as usual, welcome and you can attach them to any paragraph in need of attention.

In the next day or two I'll push Chapter 3 about The Model (a topic I pre-emptively released here a few weeks back) to the online book.

Special thanks to those who have commented on the book so far - remember that no comment is too small or petty!

As comments roll in and I read the appendix myself a few times, I'll compile a list of additional pointers worth adding in a future edit.

It would probably be a good idea to link to the Performance Appendix of the Zend Framework manual as well -- this is a constantly growing appendix, and contains a number of additional concrete tips for optimizing ZF applications. Anonymous on Jan 11 2009, 20:52

Will do in the next few days. I have time limits on these chapters, and this one ran out yesterday

. It was either publish the draft for comment or get into a habit of continually putting them off. Anonymous on Jan 11 2009, 21:02
