Mockery 0.6.1 Released

You can read more about Mockery at

<http://blog.astrumfutura.com/archives/427-Mockery-0.6-Released-PHP-Mock-Object-Framework.html>.

Mockery 0.6.1 includes a functional fix which ensures mocking classes containing variants of the `__call()` method with or without typehinting are correctly mocked/replaced. I have also downgraded the PHP dependency to 5.3.0 from 5.3.2 by request. Thanks to everyone who so far has offered feedback! Mockery has been downloaded a total of 274 times since it's original release. Counting those of you doing it twice or three times on differing machines, that probably means around 100 or more people have installed Mockery (at a guess). Remember we have a mailing list if you wish to ask any in-depth questions, you can report issues or feature requests on Github, and I'm usually somewhere on IRC (and Twitter) in the evening times (GMT).
